AI MITRA • EXPLORE AI TOGETHER

AI Tools Explorer

Top 15 tools to make learning easier, clearer and more creative

For students in Classes 8–10

A practical guide to tools for studying, research, maths, writing, revision, design, presentations, video ideas and hands-on AI experiments.

One important idea
AI should help you understand, practise and create. It should not do all your thinking or replace your own effort.

Curated student shortlist • Official tool links • Safety notes included

How to use this explorer

You do not need all 15 tools. Start with one study assistant, one research or revision tool, and one creative tool. Choose a tool based on the task you are doing.

Quick guide by task

Your task	Tools to explore
Understand a lesson / ask doubts	ChatGPT, Gemini, Microsoft Copilot
Study your own notes / PDFs	NotebookLM
Research a project	Perplexity, Gemini
Maths and science practice	Wolfram|Alpha, Photomath, Khan Academy
Remember facts and revise	Quizlet
Improve your writing	Grammarly, QuillBot
Posters, slides and videos	Canva, Adobe Express, Gamma
Try a simple AI experiment	Teachable Machine

The 15 tools

1. ChatGPT

Your all-round study companion

How it helps: Ask it to explain a difficult lesson in simple language, give examples, create a revision plan, practise questions, brainstorm project ideas, or help you understand a passage. Ask for hints and explanations rather than copying a finished answer.

Try this: “Teach me photosynthesis like I am in Class 8. Use a simple example, then ask me five questions one at a time.”

Where to find it: Website and mobile app

Open official tool website

Student note: Not for children under 13. Ages 13–18 need parental consent. Follow school and family rules.

2. Google Gemini

Explore topics and learn step by step

How it helps: Use it to explore science, history, languages and everyday questions; brainstorm stories; understand concepts; and plan projects. Its learning features can guide you through a topic instead of only giving a short answer.

Try this: “Explain electricity using examples from my home. Start with the basics and check my understanding after each part.”

Where to find it: Website and Android/iOS app

Open official tool website

Student note: Generally 13+ for personal accounts in many countries; some features have stricter age limits. Check current Google account rules.

3. NotebookLM (Google)

Study from your own notes and PDFs

How it helps: Add teacher-approved notes, textbook extracts or reference PDFs, then ask questions based on those sources. It can create study guides, summaries, FAQs and audio overviews, with citations that help you check where information came from.

Try this: “Use only the notes I added. Make a one-page revision guide and list the page or source for each key fact.”

Where to find it: Website

Open official tool website

Student note: Google says availability is for users above the applicable age of consent. Verify account eligibility before use; a parent or teacher should help younger students.

4. Perplexity

Research with links to sources

How it helps: Explore a topic and receive a summary with links to websites used. Useful for school projects, current topics and finding starting points for further reading. Open the sources yourself and compare them before using facts.

Try this: “Give me an introduction to rainwater harvesting in India. Use reliable sources and link to each source.”

Where to find it: Website and mobile app

Open official tool website

Student note: Terms require users to be 13 or older; minors need parent or guardian acceptance of the terms.

5. Microsoft Copilot

Ask questions and create school-project content

How it helps: Use it to understand topics, brainstorm ideas, summarise information, draft outlines, and create or analyse content. Some versions can help generate images and work with documents. Features depend on account and region.

Try this: “Help me plan a school presentation on renewable energy. Give me six sections and explain what I should research for each.”

Where to find it: Website, mobile app and some Microsoft products

Open official tool website

Student note: Account and age rules depend on the version and school account. Ask a parent or teacher to check eligibility.

6. Khan Academy

Build subject knowledge with guided practice

How it helps: Learn maths, science and other subjects through lessons, videos and practice exercises. Khan Academy's AI tutor, Khanmigo, may be available only in selected locations, plans or school programmes; the core learning library is useful even without it.

Try this: “Study fractions: watch one lesson, solve the practice questions, and write down the step I found difficult.”

Where to find it: Website and mobile app

Open official tool website

Student note: Khanmigo access and eligibility vary by country and account type. Do not assume the AI tutor is available to every student in India.

7. Wolfram|Alpha

Understand maths and science problems

How it helps: Check calculations, explore graphs, work with equations and investigate science or maths questions. Step-by-step solutions and some advanced features may require a paid plan, so use the free results as a starting point.

Try this: “Plot $y = 2x + 3$ and explain what the slope and y-intercept mean.”

Where to find it: Website and mobile apps

Open official tool website

Student note: Some features are paid. Follow the service's current account and age requirements.

8. Photomath

Learn the steps behind a maths solution

How it helps: Scan or enter a maths problem to see a worked solution. Use it to find the step you do not understand, then close the app and solve a similar question yourself. It is a maths-learning aid, not a substitute for practice.

Try this: “I understand the first two steps, but not why the equation changes in step three. Explain that step.”

Where to find it: Mobile app

Open official tool website

Student note: Basic and paid features differ. Check current age, account and parental-consent requirements in the app store and service terms.

9. Quizlet

Revise with flashcards and practice

How it helps: Create flashcards for vocabulary, science terms, dates and definitions. Use available practice modes to test memory and revisit the words or ideas you keep forgetting. Some AI study features may be limited or paid.

Try this: “Turn these teacher-approved biology terms into question-and-answer flashcards. Keep each answer short.”

Where to find it: Website and mobile app

Open official tool website

Student note: Features and account rules vary by age and region. Check current terms and use a parent or teacher's guidance.

10. Grammarly

Improve grammar and clarity in your writing

How it helps: Check spelling, punctuation, sentence clarity and tone in drafts. Use its suggestions to understand your mistakes and improve your own writing. Keep your ideas and voice; do not submit AI-written work as your own.

Try this: “Explain why these three sentences are grammatically incorrect, then show me how to correct them.”

Where to find it: Website, browser extension and apps

Open official tool website

Student note: Some features require an account or paid plan. Check the current minimum-age rules before signing up.

11. QuillBot

Understand and improve sentences

How it helps: Use its paraphraser, summariser and grammar tools to compare different ways of expressing an idea or shorten a passage for revision. Always read the original source, preserve its meaning and cite it in schoolwork.

Try this: “Show me two simpler ways to express this sentence without changing its meaning. Explain the changes.”

Where to find it: Website and browser tools

Open official tool website

Student note: Free use has limits and some features are paid. Check age and account requirements before use.

12. Canva

Design posters, presentations and visual projects

How it helps: Create science-fair posters, diagrams, presentations, infographics, invitations and short videos using templates and design tools. Canva includes AI features, but access depends on account type, age and plan. Canva Education is accessed through an eligible teacher or school.

Try this: “Help me design a clear one-page poster about saving water. Suggest a title, three key facts and a simple layout.”

Where to find it: Website and mobile app

Open official tool website

Student note: Canva's AI features are generally for users 13+ unless used through Canva Education under teacher supervision. Education access requires an eligible teacher/school invitation.

13. Adobe Express

Create visual stories and short videos

How it helps: Make posters, social-style educational graphics, presentations and short videos. Templates and editing tools help students communicate a project clearly. Some generative AI features are powered by Adobe Firefly and may have usage limits.

Try this: “Plan a 30-second classroom video explaining the water cycle. Give me a simple scene-by-scene storyboard.”

Where to find it: Website and mobile app

Open official tool website

Student note: Adobe account, age and generative-AI eligibility rules apply. A parent or teacher should check the current terms before a student creates an account.

14. Gamma

Turn an outline into a presentation

How it helps: Build a first draft of a presentation or visual document from a topic or outline. Students should fact-check the content, rewrite it in their own words and add sources instead of submitting the generated slides unchanged.

Try this: “Create a 6-slide outline for a Class 9 presentation on the solar system. Keep each slide to one main idea.”

Where to find it: Website

Open official tool website

Student note: Free-plan limits and account eligibility can change. Check current age and terms; use with teacher or parent guidance.

15. Teachable Machine (Google)

Experiment with how machine learning works

How it helps: Make simple no-code machine-learning experiments using images, sounds or body poses. Students can collect examples, train a small model and test where it succeeds or makes mistakes. Great for understanding that AI learns patterns from examples.

Try this: “Make a classroom demo that recognises two hand gestures. Test it in different lighting and note when it makes mistakes.”

Where to find it: Website (works in a browser)

Open official tool website

Student note: Use teacher supervision. Do not upload identifiable photos, voices or personal data of classmates without permission.

Use AI wisely

1. Learn, do not copy. Ask for explanations, hints, examples and practice. Write your final schoolwork in your own words.

2. Check important facts. AI can make mistakes or invent details. Compare answers with your textbook, teacher and trustworthy sources.

3. Protect your privacy. Do not enter passwords, OTPs, home addresses, phone numbers, private photos or personal information about classmates.

4. Follow age rules. Some tools require users to be 13+, parental consent, a school account or teacher invitation. Features and access can differ by country.

5. Respect school rules. Ask your teacher before using AI for assignments, and clearly acknowledge AI help when your school requires it.

A simple student workflow

1. Try to understand the topic yourself.
2. Ask an AI tutor to explain the confusing part.
3. Check the explanation against your textbook or class notes.
4. Close the tool and solve a question yourself.
5. Use a creative tool to present what you learned.

A note from AI Mitra

The internet contains thousands of AI tools, and new ones appear regularly. This is a curated top-15 selection for common school learning tasks—not a list of every tool available online. Free plans, features, age rules and availability can change, so check the official website before creating an account or paying.
